

# Quarterly Panorama of European business statistics

2-2010

2010 edition

## How to obtain EU publications

Our priced publications are available from EU Bookshop (<http://bookshop.europa.eu>), where you can place an order with the sales agent of your choice.

The Publications Office has a worldwide network of sales agents. You can obtain their contact details by sending a fax to (352) 29 29-42758.

*Europe Direct is a service to help you find answers to your questions about the European Union*

Freephone number (\*):

**00 800 6 7 8 9 10 11**

(\*): Certain mobile telephone operators do not allow access to 00 800 numbers or these calls may be billed.

More information on the European Union is available on the Internet (<http://europa.eu>).

Luxembourg: Publications Office of the European Union, 2010

ISSN 1725-485X

Cat. No. KS-DL-10-002-EN-N

**Theme: Industry, trade and services**

**Collection: Statistical books**

© European Union, 2010

Eurostat is the Statistical Office of the European Communities. Its mission is to provide the European Union with high-quality statistical information. For that purpose, it gathers and analyses figures from the national statistical offices across Europe and provides comparable and harmonised data for the European Union to use in the definition, implementation and analysis of Community policies. Its statistical products and services are also of great value to Europe's business community, professional organisations, academics, librarians, NGOs, the media and citizens.

Eurostat's publications programme consists of several collections:

- **News releases** provide recent information on the Euro-Indicators and on social, economic, regional, agricultural or environmental topics.
- **Statistical books** are larger A4 publications with statistical data and analysis.
- **Pocketbooks** are free of charge publications aiming to give users a set of basic figures on a specific topic.
- **Statistics in focus** provides updated summaries of the main results of surveys, studies and statistical analysis.
- **Data in focus** present the most recent statistics with methodological notes.
- **Methodologies and working papers** are technical publications for statistical experts working in a particular field.

Eurostat publications can be ordered via the EU Bookshop at <http://bookshop.europa.eu>.

All publications are also downloadable free of charge in PDF format from the Eurostat website <http://ec.europa.eu/eurostat>. Furthermore, Eurostat's databases are freely available there, as are tables with the most frequently used and demanded short- and long-term indicators.

Eurostat has set up with the members of the 'European statistical system' (ESS) a network of user support centres which exist in nearly all Member States as well as in some EFTA countries. Their mission is to provide help and guidance to Internet users of European statistical data. Contact details for this support network can be found on Eurostat Internet site.

## Data extracted: 26-5-2010

The Quarterly panorama of European business statistics has the objective of furnishing readers with an instrument which will allow them to follow the evolution of short-term economic trends in relation to the business sector of the economy (as defined by NACE Rev. 2 Sections B to N).

This is the second edition of the publication in 2010; it is produced by Eurostat Unit G3 – responsible for short-term business statistics (STS). Note the STS database has switched to the NACE Rev. 2 classification and the base year for indices has generally been revised to 2005=100. The publication will be released on a regular, quarterly basis.

The classification (NACE Rev. 2) has been modernised by introducing new detail to reflect different forms of production and emerging industries. The detail of the classification has substantially increased in service-producing activities. NACE Rev. 2 provides a better picture of the overall economy and facilitates international comparisons.

The publication follows the structure of the STS Regulation, insofar as it presents a selection of key indicators for industry, construction, retail trade and other services. Among the most important indicators are a set of Principal European Economic Indicators (PEEIs) that are essential to the European Central Bank for reviewing monetary policy within the euro area.

For 2010, data sources have been introduced: these may be found under each table and graph throughout the publication. The codes that have been introduced allow the reader to easily access the most recent data on the Eurostat website. Users are led directly to the relevant table when clicking on these hyper-links that are composed of data code(s). The links open complete data sets in a web browser in Eurostat's Data Explorer application. Note that the data on the website is frequently updated and may also be more detailed or be available in a variety of different measurement units (these can be modified by using the Select Data tab in the application).

Readers may be interested to learn that a new set of **main tables** are available for STS on the Eurostat website. These cover some of the key short-term business statistics across the whole of the business economy. The data is automatically updated from the latest information available within Eurostat databases. The indicators are divided according to the annexes of the short-term statistics regulation (STS-R).

In order to access these tables – use the following link:

[http://epp.eurostat.ec.europa.eu/portal/page/portal/short\\_term\\_business\\_statistics/data/main\\_tables](http://epp.eurostat.ec.europa.eu/portal/page/portal/short_term_business_statistics/data/main_tables)

A large, bold, blue number '1' is positioned on the left side of the page, partially overlapping the white background and the blue background.

## Industry

### Index of production

There were continued signs of recovery within the EU-27's industrial economy. The seasonally adjusted index of production for total industry (excluding construction) rose by 1.2 % during March 2010 (compared with the previous month); the same growth rate was recorded for the euro area. These latest figures mark the tenth consecutive month-on-month increases for both the EU-27 and the euro area, with industrial output rising continuously from June 2009 onwards, with somewhat higher growth rates generally recorded towards the end of the period under consideration.

**Figure 1.1:** Index of production for total industry (excl. construction), seasonally adjusted, growth rates compared with previous month (%)

**Table 1.1:** Index of production, seasonally adjusted, growth rates compared with previous month, EU-27 (%)

	12-09	01-10	02-10	03-10
Intermediate goods	-0.5	0.2	1.0	0.5
Capital goods	-0.2	0.2	0.4	1.1
Consumer durables	-0.7	2.0	0.5	-0.5
Consumer non-durables	0.3	0.9	-0.4	1.1
Energy	2.0	2.7	-1.9	-0.3

Source: Eurostat (sts\_inprgr\_m)

**Figure 1.2:** Index of production, trend cycle, EU-27 (2005=100)

Source: Eurostat (sts\_inpr\_m)

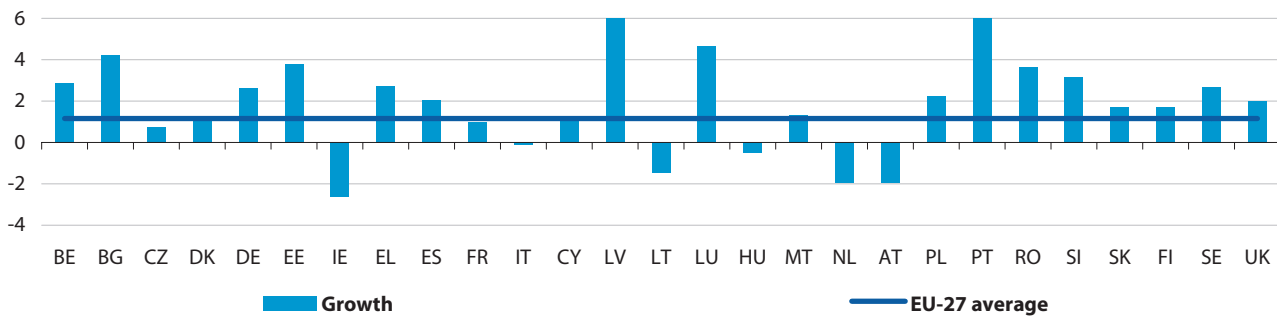

A comparison based on working-day adjusted indices shows that industrial output in the EU-27 rose by 5.9 % between March 2009 and March 2010, while the corresponding rate for the euro area was 6.7 %. These figures were in stark contrast to those recorded a year before, when industrial output had been falling by around 20 % in the EU-27 and the euro area.

Among the main industrial groupings (MIGs), it was the manufacture of capital goods and the manufacture of consumer non-durables which contributed most to the overall growth in EU-27 industrial production in March 2010. For both of these MIGs, the seasonally adjusted index of production rose by 1.1 % for the EU-27 in March 2010 (compared with the previous month), while the manufacture of intermediate goods increased by 0.5 %. In contrast, EU-27 production indices for energy (-0.3 %) and for consumer durables (-0.5 %) fell during the same period.

There was a relatively high rate of growth in industrial output for Germany (2.6 % in March 2010), with production rising at more than twice the EU-27 average, while Spain (2.1 %) and the United Kingdom (2.0 %) were the other large Member States to report relatively high increases in industrial output in March 2010. Indeed, when taking account of the relative size of each Member State and its weight in the EU-27 total, almost half of the production increase recorded for the EU-27 in March 2010 could be attributed to the German industrial economy, while just under a fifth resulted from industrial output rising in the United Kingdom and Spain was the only other Member State to make a significant contribution (at least a double-digit share).

While their weight in the overall EU-27 figure was less significant, some of the smaller Member States recorded the highest month-on-month growth rates for industrial output, as production increases peaked at 9.9 % for Latvia and 7.2 % for Portugal; Luxembourg, Bulgaria, Estonia, Romania and Slovenia also recorded increases of more than 3 % during March 2010.

**Figure 1.3:** Index of production, total industry (excl. construction), seasonally adjusted, growth rates compared with previous month, 03-2010 (%) (1)

(1) Latvia, broken y-axis, value is 9.9; Portugal, broken y-axis, value is 7.2; Belgium, 02-2010.  
Source: Eurostat ([sts\\_inprgr\\_m](#))

The index of production for total industry was almost unchanged in Italy (-0.1 %), which was one of six Member States where industrial output fell in March 2010, the others being Hungary, Lithuania, Austria, the Netherlands and Ireland; the latter recording the biggest decline in industrial output among the Member States (-2.6 %).

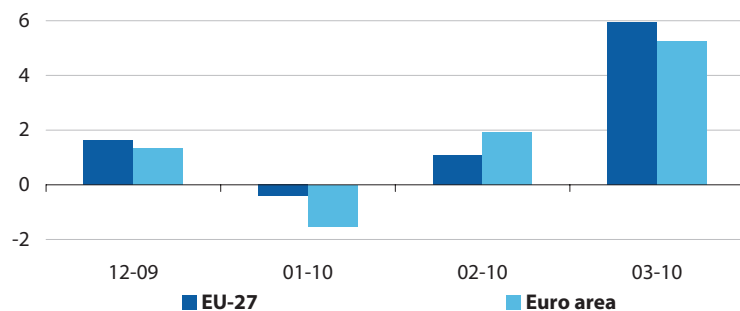

At a more detailed level (using NACE Rev. 2 Divisions) there was a rapid 13.2 % month-on-month increase in EU-27 production for the mining of metal ores (NACE Rev. 2 Division 07); note this is a very small activity and contributed only 0.2 % to overall industrial activity. The next highest growth rates were for the manufacture of coke and refined petroleum products (Division 19) where EU-27 output increased by 7.5 %, the manufacture of basic metals (Division 24, 5.3 %), and the manufacture of other non-metallic mineral products (Division 23, 3.9 %); none of the remaining industrial activities recorded an expansion in output of more than 3 %.

### Index of new orders

The seasonally adjusted index of total new orders for manufacturing industries working on orders rose by 5.9 % in the EU-27 in March 2010 and by 5.2 % in the euro area, following on from growth of 1.1 % and 1.9 % the month before. The latest seasonally adjusted index for the EU-27 (102.6 in March 2010) rose above its base year value (2005=100) for the first time since October 2008.

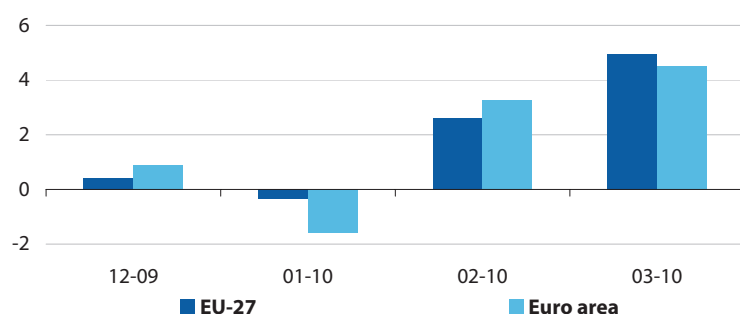

A breakdown of new orders between those originating from domestic markets and abroad suggests that the pick-up in order books in recent months was driven by both components of the total, as EU-27 domestic new orders rose by 7.8 % in March 2010 (compared with the month before),

**Figure 1.4:** Index of total new orders received for manufacturing industries working on orders, seasonally adjusted, growth rates compared with previous month (%)

Source: Eurostat ([sts\\_innogr\\_m](#))

**Figure 1.5:** Index of total new orders received for manufacturing industries working on orders (excl. heavy transport equipment), seasonally adjusted, growth rates compared with previous month (%)

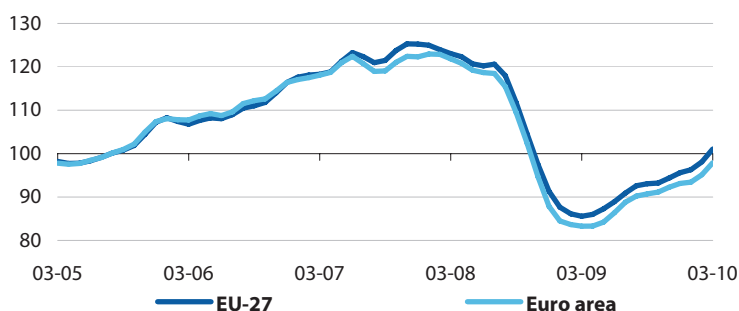

Source: Eurostat ([sts\\_innogr\\_m](#))

while the corresponding figure for non-domestic orders was 4.7 %. Four of the Member States recorded double-digit increases for domestic orders in March 2010 (Greece, France, Poland and the United Kingdom), while five countries reported double-digit increases for non-domestic orders (Denmark, Estonia, Latvia, Austria (February 2010) and Romania). Of these (taking account of the weight of each Member State in the EU-27 total), France accounted for more than a third of the EU-27 increase for domestic new orders, while between one quarter and a fifth of the increase could be attributed to Germany and to the United Kingdom. For non-domestic orders, the largest contribution to EU-27 developments was from Germany, where a 5.6 % increase in non-domestic orders contributed almost half of the EU-27's overall increase.

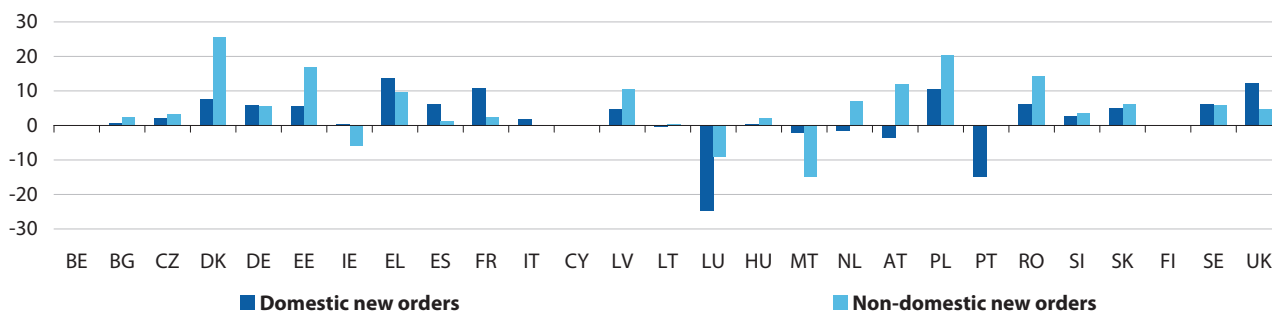

Working-day adjusted total new orders were 20.7 % higher in the EU-27 in March 2010 when compared with a year before; composed of a 15.6 % increase in domestic orders and a 24.8 % rise for non-domestic orders.

## Indices of labour input

While there were signs of an upturn in order books and output, labour input indicators for the industrial economy continued to lag, posting negative rates, as the seasonally adjusted number of persons employed within total industry fell by 1.3 % in the euro area in the first quarter of 2010 (compared with the quarter before); this was the eighth consecutive quarter that the number of persons employed was cut.

Within the EU-27, there was a 2.9 % reduction in the number of persons employed manufacturing consumer durables in the first quarter of 2010, while employment was also shed for the other four MIGs, albeit at a less rapid pace: -1.4 % for the manufacture of intermediate goods, -1.1 % for both the manufacture of capital goods and consumer non-durables, and -0.4 % for energy-producing activities.

There were signs that the contraction in the number of hours worked in total industry was slowing. From a 3.5 % reduction in the first quarter of 2009 for both the EU-27 and the euro area, the number of hours worked was almost unchanged in the euro area (-0.1 %) during the first quarter of 2010, while there was a decline of 0.7 % for the EU-27 in the final quarter of 2009 (no fresher data available). The trend in these figures supports the view that although employers were, at the time of writing, generally not seeking to take on new staff, they were starting to expand the use of overtime (perhaps in order to meet higher levels of demand).

**Table 1.2:** Indices of employment, hours worked and wages and salaries for total industry (excl. construction), seasonally adjusted, growth rates compared with previous quarter, EU-27 (%)

	I-09	II-09	III-09	IV-09
<b>Employment</b>	-2.3	-2.8	-1.9	-1.1
<b>Hours worked</b>	-3.5	-2.4	-0.8	-0.7
<b>Wages and salaries</b>	-2.9	-1.6	-1.0	-0.6

Source: Eurostat (sts\_inlbgr\_q)

Among the industrial NACE Rev. 2 divisions for which data are available, there were seven that reported an expansion in their respective number of persons employed. The largest gain was posted for water collection, treatment and supply (Division 36), where the index of employment rose by 1.4 % in the EU-27 between the final quarter of 2009 and the first quarter of 2010. The mining of metal ores (Division 07) was the only other activity where the number of persons employed in the EU-27 rose by upwards of 1 % (latest data for the final quarter of 2009). At the other end of the range, the biggest losses were reported among activities where the EU-27 has traditionally shed labour in recent decades, namely, the manufacture of wearing apparel (Division 14) and other mining and quarrying (Division 08), with job losses amounting to 3.7 % and 4.7 % respectively in the EU-27 in the first quarter of 2010.

### Index of prices

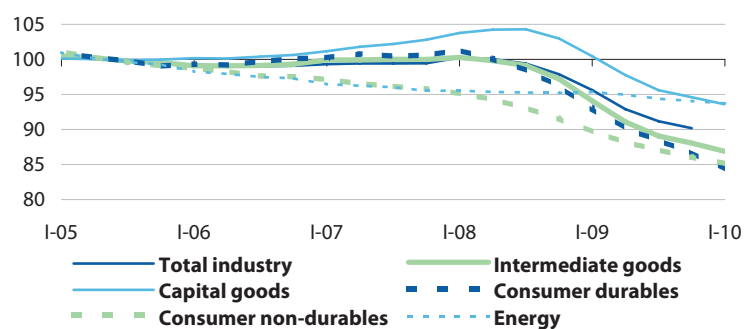

There was a fluctuating pattern to the development of prices across the EU-27, as the index for domestic output prices (gross) rose by 0.8 % in January (compared with the month before),

**Table 1.3:** Indices of employment, hours worked and wages and salaries for total industry (excl. construction), seasonally adjusted, growth rates compared with previous quarter, euro area (%)

	II-09	III-09	IV-09	I-10
<b>Employment</b>	-2.2	-1.7	-1.0	-1.3
<b>Hours worked</b>	-1.4	-0.5	-0.1	-0.1
<b>Wages and salaries</b>	-1.5	-1.1	-0.8	:

Source: Eurostat (sts\_inlbgr\_q)

**Figure 1.8:** Index of employment, seasonally adjusted, EU-27 (2005=100)

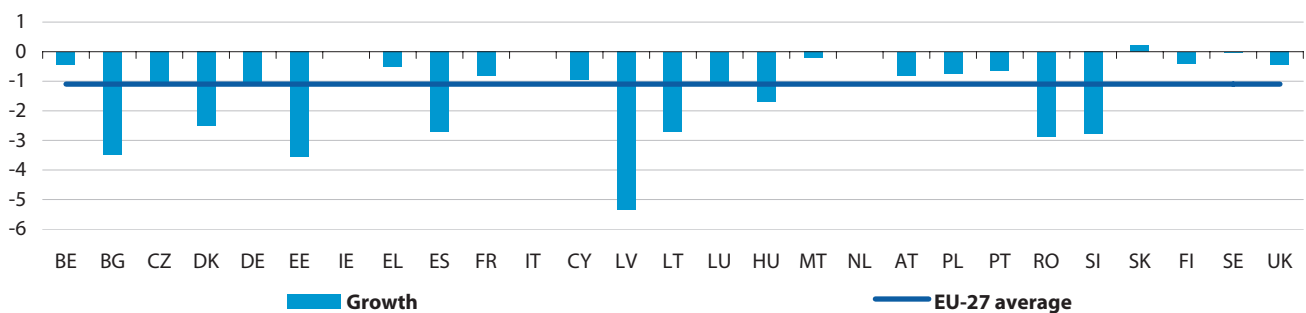

Source: Eurostat (sts\_inlb\_q)

followed by almost no change in February (0.1 %) and another increase of 0.8 % in March 2010; as a result, EU-27 domestic output prices increased for the sixth consecutive month.

A breakdown for the EU-27 in March 2010 shows there was little difference in the rate at which prices were rising between the domestic market (up 0.8 % compared with the month before) and the non-domestic market (up 0.7 %).

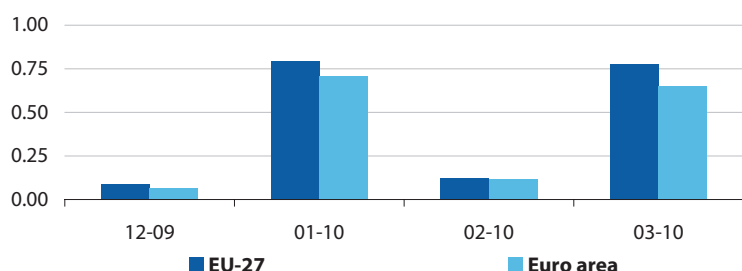

**Figure 1.9:** Index of employment, total industry (excl. construction), seasonally adjusted, growth rates compared with previous quarter, IV-2009 (%) (1)

 (2) Portugal, not available; Denmark, Estonia, Latvia, Lithuania, Slovenia, Finland and the United Kingdom, 04-2010.

Source: Eurostat (sts\_inppdgr\_m)

The fluctuating pattern to price developments within the EU-27 could, to a large degree, be attributed to energy prices, as with these removed from the total industry aggregate the latest three month-on-month rates of change were 0.2 %, 0.1 % and 0.3 %. Indeed, inflationary pressures appeared to be relatively muted within the EU-27 during the first quarter of 2010, other than those linked to the rising cost of energy, with the pattern of rising energy prices apparent since September 2009.

Between February and March 2010, domestic output prices rose by upwards of 1 % in Spain, Portugal (both April 2010), Belgium, Bulgaria, Greece and Luxembourg, while price increases in Latvia (also in April 2010) were considerably higher, at 2.8 %. Prices rose modestly in most of the remaining Member States, while there was no change in Malta and price reductions of 0.3 % and 1.7 % were recorded for Ireland and Sweden.

A comparison of domestic output price increases between March 2009 and March 2010 shows that three of the NACE Rev. 2 Divisions for which data are available had much higher price increases: across the EU-27 the price of coke and refined petroleum products (Division 19) rose by 35.5 %, those for the extraction of crude petroleum and natural gas (Division 06) by 30.8 %, and those for the mining of metal ores (Division 07) by 15.8 %. Domestic output prices also increased for a further 14 of the NACE Rev. 2 divisions for which data are available – rising by between 0.1 % and 6.2 %. The biggest reduction in domestic output prices in the EU-27 between March 2009 and March 2010 was recorded for electricity, gas, steam and air conditioning (Division 35) where prices fell by 11.5 %, while prices fell there were reductions for a further ten industrial activities.

## Construction

### Index of production

Seasonally adjusted construction activity fell by 5.3 % and 7.2 % in the EU-27 and the euro area in February 2010 (compared with the previous month). However, it rebounded by a similar magnitude in March 2010, as the index of production for construction rose by 6.5 % for the EU-27 and by 7.3 % for the euro area. The overwhelming share of the EU-27 increase could be attributed to Germany, whose weighted contribution to the EU-27 index accounted for more than 80 % of the latest change; Spain also made a relatively important contribution, accounting for almost a fifth of the change.

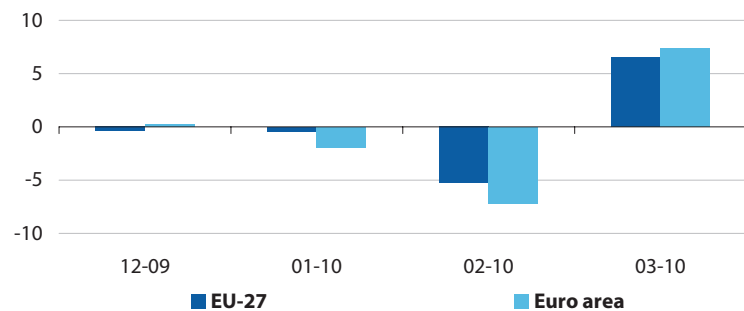

The vast majority of the increase in construction activity could be attributed to building, as the index of production for building rose by 6.9 % in the EU-27, whereas civil engineering works saw their output rise by just 1.9 %; in addition, the building sector is considerably larger than civil engineering activities. These latest developments marked a distinct change in relation to the trend observed during the economic downturn, when the output of the civil engineering industry remained relatively unchanged, while there was a considerable reduction in building activity. While the downturn in building activity may be showing signs of coming to an end, civil engineering activity has instead waned since the final quarter of 2009.

### Indices of labour input

There was no sign of any upturn in the fortunes of the EU-27's construction sector on the basis of the most recent figures for labour input indicators. The number of persons employed fell by 1.6 % in the final quarter of 2009 (on the basis of a seasonally adjusted comparison with the previous quarter), while there was a 3.1 % reduction in hours worked and a 3.4 % decline in wages and salaries.

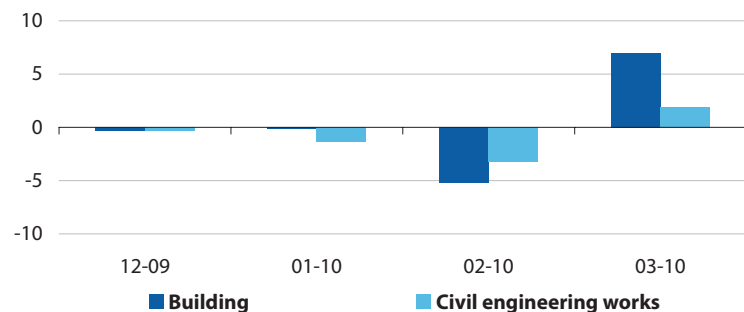

Among the Member States there were only three countries reporting an increase in their respective construction workforces in the final quarter of 2009 (no change reported in the United Kingdom). The number of persons employed in Denmark rose by 1.2 % (first quarter of 2010), while the latest employment growth rates for Germany and Belgium were 0.4 % and 0.1 % respectively.

**Figure 1.14:** Index of production for construction, seasonally adjusted, growth rates compared with previous month (%)

**Figure 1.18:** Index of the number of dwellings for which building permits are issued for new residential buildings, seasonally adjusted, growth rates compared with previous quarter (%)

Source: Eurostat ([sts\\_cobpgr\\_q](#))

### Construction costs

With construction costs falling in the last quarter of 2008 and the first two quarters of 2009, the EU-27's index for new residential buildings returned to growth in the third and final quarters of 2009, rising by 0.9 % and 0.3 % respectively (in comparison with the previous quarter). The development of the overall construction cost index for the EU-27 can be largely attributed to the material cost component, which reported four negative rates of change during the period from the final quarter of 2008 through to the third quarter of 2009. In contrast, the EU-27's labour costs index continued to record positive quarter-on-quarter rates of change within the range of 0.4 % to 1.1 % during the period from the final quarter of 2008 to the final quarter of 2009.

The increase in construction costs during the second half of 2009 did not prevent EU-27 construction costs from falling overall during 2009 (down 1.5 % compared with the year before); as such, the EU-27 construction costs index

**Table 1.4:** Indices of employment, hours worked and wages and salaries for construction, seasonally adjusted, growth rates compared with previous quarter, EU-27 (%)

	I-09	II-09	III-09	IV-09
<b>Employment</b>	-2.4	-2.0	-2.0	-1.6
<b>Hours worked</b>	-2.4	-3.5	-3.6	-3.1
<b>Wages and salaries</b>	-2.3	-2.4	-1.7	-3.4

Source: Eurostat ([sts\\_colbgr\\_q](#))

posted its first annual contraction since records began in 1994.

Among the Member States, the index of construction costs fell in 11 of the 22 countries for which data are available for the whole of 2009 (Bulgaria, Luxembourg, Malta and the United Kingdom, not available; Italy, confidential). The largest contraction in costs was recorded in Lithuania (-14.5 %), while Ireland (-9.9 %) and the other two Baltic Member States (Estonia (-8.5 %) and Latvia (-6.4 %)) were the only other countries to report significant reductions in costs in 2009. The vast majority of Member States reported changes in construction costs that were within the range of +/-1.5 %, with Sweden (2.0 %), Slovakia (2.1 %) and Hungary (3.0 %) the only countries to report costs increasing by a higher margin.

### Number of permits

The seasonally adjusted index of the number of dwellings in new residential buildings for which building permits were issued fell by 5.7 % in the EU-27 and by 2.3 % in the euro area during the final quarter of 2009 (compared with the previous quarter). This continued a lengthy on-going series of negative rates, as the number of dwellings for which permits were issued fell consistently throughout the whole of 2007 and 2008 for both the EU-27 and the euro area.

Annual figures for 2009 show that the number of dwellings for which permits were issued fell by 22.7 % in the EU-27 – a similar rate of decline to that recorded in 2008 (-26.7 %) and more than twice the reduction that was registered in 2007 (-9.2 %). Among the Member States, Germany posted an increase in its number of dwellings for which permits were issued in 2009, up by 3.3 % compared with the year before. This was the only expansion among the 25 countries for which data are available (France, not available; Italy, confidential).

## Services

### Volume of sales for retail trade

The volume of retail sales was static across Europe in March 2010. The latest seasonally adjusted indices showed sales rising by just 0.1 % (compared with the month before) in the EU-27, while there was no change in the euro area.

The trend form of the retail trade volume of sales index (base year 2005=100) fell to relative lows of 100.7 and 104.2 in the euro area and the EU-27 during the autumn of 2009 (September and October 2009 respectively), after which there was almost no change in retail sales volumes through to March 2010.

In March 2010 the seasonally adjusted index for the volume of retail sales of food, beverages and tobacco in the EU-27 rebounded by 0.3 % (following declines of 0.3 % and 0.4 % in the first two months of the year). The volume of sales of non-food products also fell in January 2010 (-0.7 %), but posted positive rates of change in February (0.3 %) and March (0.2 %) 2010.

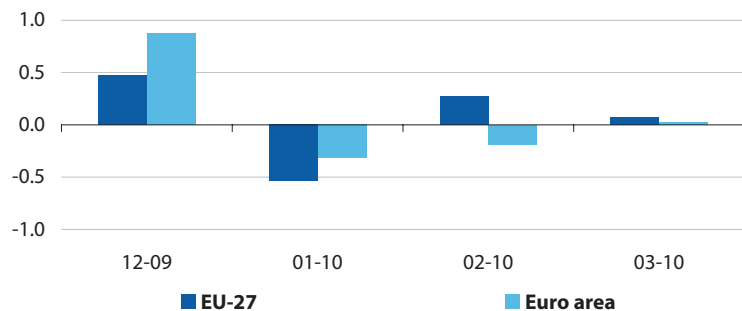

Across the Member States, retail sales volumes were rising at a relatively fast rate (upwards of 2.0 %) in March 2010 in Slovakia, Poland, Latvia, Romania, with the latest month-on-month rates of change peaking in Lithuania (4.8 %) and Denmark (5.5 %). Of the 15 remaining countries for which data are available (Greece, Spain, Italy, Cyprus, Hungary and the Netherlands, confidential), there were 11 that reported a rate of change within the range of -0.1 % to 0.8 %. Four countries saw their retail sales fall by at least 1 %. The impact of the 1.6 % decline for Germany was particularly important in dragging down the EU-27 average, given its weight in the EU-27 total.

### Index of turnover

Sales within the EU-27's services sector (as covered by the STS Regulation) fell to a relative low in the second quarter of 2009, after which there were two successive quarters of accelerating growth, as turnover rose by 0.6 % and 1.3 % through to the final quarter of the year.

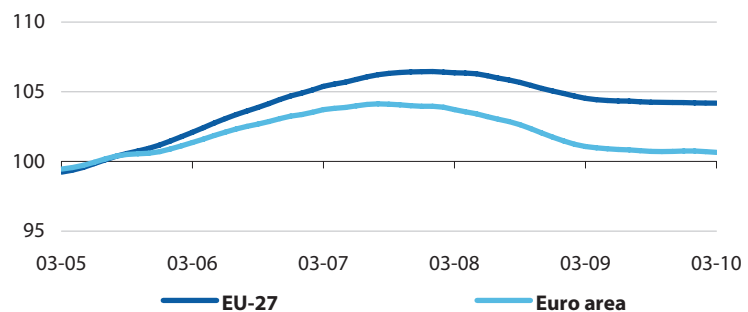

The apparent upturn in sales for the services sector was reflected at a more detailed level too, as positive rates of change were posted for 13 of

Source: Eurostat (sts\_trtugr\_m)

the 22 NACE Rev. 2 divisions covered by the STS Regulation. The EU-27 turnover index rose by 2.4 % in the final quarter of 2009 for wholesale trade (NACE Rev. 2 Division 46), while the highest sales growth was reported for office administration and support activities (Division 82, 2.7 %); note that wholesale trade is the largest of the services covered by the STS Regulation and hence its relatively high growth rate in the final quarter of 2009 played an important role in helping to boost the overall growth rate for services. At the other end of the range, sales declined by more than 1 % in the final quarter of 2009 for four NACE divisions, with the biggest reductions being recorded for the relatively small activity of water transport (Division 50, -3.1 %) and for motor trades (Division 45, -3.3 %).

The majority of the Member States reported a positive development in sales within the services sector for the latest period available (either the final quarter of 2009 or the first quarter of 2010). Quarter-on-quarter growth rates for the index of turnover peaked in Luxembourg (6.8 %, final quarter of 2009) and Malta (5.5 %, first quarter of 2010), although the 3.3 % increase in Swedish turnover had a much larger influence on the EU-27 aggregate when taking account of the weight of each country. Among those Member States for which data are available (Belgium and Italy, not available), there were eight countries where sales within the services sector fell. Three of these reported that turnover fell by more than 1 % in the final quarter of 2009, namely, Ireland (-1.7 %), Bulgaria (-2.9 %) and Lithuania (-3.6 %). However, the 0.8 % reduction in sales within the United Kingdom in the first quarter of 2010 had a greater influence on the EU-27 average (given its higher weight in the EU total).

### Index of employment

The seasonally adjusted index of employment for services fell 0.1 % between the third and final quarters of 2009, continuing a pattern of negative rates that started in the third quarter of 2008. However, the pace at which jobs were being shed within the EU-27's services sector slowed for the third consecutive quarter, having peaked at -1.3 % in the first quarter of 2009.

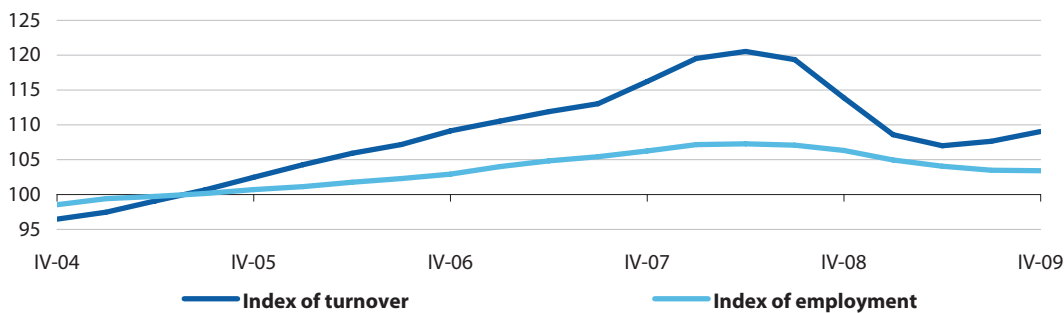

Only three of the 17 NACE aggregates for which EU-27 data are available for the final quarter of 2009 or the first quarter of 2010 reported growth in their respective workforces, with the largest expansion reported for administration and support activities (most of NACE Rev. 2 Section N, 2.7 %) in the final quarter of 2009, while there was growth of 0.3 % for accommodation and food services (Section I, first quarter of 2010) and for telecommunications (Division 61, final quarter of 2009). The majority of the remaining activities reported a declining number of persons employed, with rates of change between 0 and -1 %, although job losses in the final quarter of 2009 were more significant for the activities of publishing (Division 58, -1.2 %), film, TV and sound production (Division 59, -1.9 %) and air transport (Division 51, -2.3 %).

### Index of services prices

Services producer price indices increased at a rapid pace for sea and coastal water transport in both the EU-27 (6.9 %) and especially the euro area (12.8 %) between the third and final quarters of 2009. This confirmed a turnaround in price developments for sea and coastal water transport, as prices rose by 4.5 % and 11.0 % in the third quarter of 2009 – having previously fallen at a rapid pace for three consecutive quarters.

The majority of the other activities for which data are available reported price increases. The next highest increases were for air transport (Division 51) where prices rose by 1.7 % for the EU-27 and 3.0 % for the euro area, while none of the other activities saw their prices rise by more than 1 %. The only activity to record falling prices was that of telecommunications (Division 61), where prices fell by 2.4 % for the EU-27 (2.3 % for the euro area) – thereby continuing the general pattern of falling prices for this activity.

## Methodological notes

## Statistical sources

The data used in this publication is harmonised data supplied to Eurostat by the National Statistical Offices. Eurostat calculate the European aggregates for the EU-27 and euro area. Eurostat also perform some decomposition of indices (when these are not provided directly by the Member States), in order to produce other presentations of data (such as the trend cycle). Eurostat data are available free of charge at the following address <http://ec.europa.eu/eurostat>.

## Short-term statistics (STS) Regulation - the legal basis

The main basis of the information presented in this publication is the Council Regulation No 1165/98 of 19 May 1998 concerning short-term statistics (available at <http://eur-lex.europa.eu>), hereafter referred to as the STS-Regulation. Despite the major changes brought in by the STS-Regulation, and the great improvements in the availability and timeliness of EU indicators that followed its implementation by the Member States, strong demands for further development were voiced even as the STS-Regulation was being adopted. The emergence of the European Central Bank (ECB) changed expectations as regards STS. The STS Regulation was amended by Regulation (EC) No 1158/2005 of the European Parliament and of the Council of 6 July 2005 amending Council Regulation (EC) No 1165/98 concerning short-term statistics. Among the main changes introduced were:

- New indicators for the purpose of analysis, namely the introduction of industrial import prices, services output prices, and the division of non-domestic turnover, new orders and industrial output prices between euro area and non-euro area countries.
- More timely data, by shortening deadlines for the delivery of the industrial and construction production indices, the retail trade and services turnover (and volume of sales) indices, and employment indices for all activities.
- More frequent data, increasing the frequency of the production in construction index to monthly from quarterly.

## Classifications and related definitions

### Activity classifications

The economic activities used in this publication are defined in the Classification of Economic Activities within the European Communities, known as NACE. A revised version of the statistical classification of economic activities in the European Community (NACE Rev. 2) has been implemented in STS. Simultaneously with the introduction of NACE Rev. 2, a new base year (2005) was adopted for the indices to better reflect the economic structure.

The classification (NACE Rev. 2) has been modernised by introducing new detail to reflect different forms of production and emerging industries. The detail of the classification has substantially increased in service-producing activities. NACE Rev. 2 provides a better picture of the overall economy and facilitates international comparisons.

Note that within the services sector there are some special aggregates that have been produced to provide details of NACE Rev. 2 Sections M and N; these aggregates are not complete in terms of their coverage (footnotes are provided under tables and graphs whenever these aggregates are used within the publication).

### Main industrial groupings (MIGs)

The objective of the main industrial groupings (MIGs) is to provide an activity breakdown of industry (NACE Rev. 2 Sections B to E inclusive) which is an intermediate level between the Sections and the Divisions of NACE. There are five MIGs, which, despite the reference to 'goods', in fact regroup all activities without exception in NACE Sections B to E. These are:

- intermediate goods;
- capital goods;
- consumer durables;
- consumer non-durables;
- energy.

The definitions for each of the MIGs headings are based on the Division and Group level of NACE Rev.2, these are defined by Commission Regulation (EC) No 656/2007 of 14 June 2007 amending Regulation (EC) No 586/2001 on implementing Council Regulation (EC) No 1165/98 concerning short-term statistics as regards the definition of main industrial groupings (MIGs). It should be noted that the MIGs are not comparable in terms of their (economic) size, the consumer durables heading is, in particular, smaller than the others. For new orders, the MIGs are defined as a sub-group of activities (limited to those manufacturing activities that work on orders).

### Classifications of types of constructions

The classification of types of constructions (CC) has been developed on the basis of the central product classification (CPC). The classification is a 4-level hierarchical system. The principal breakdown, at the Section level is between civil engineering and buildings. Below this level the CC differentiates primarily according to the technical design which results from the special use of the structure and, in particular for buildings, according to the main use. It should be noted that there is no legal basis for the CC. However, the publication of the CC contains many introductory remarks that provide definitions and classification guidelines, essential for a clear and coherent implementation of the classification. For more information on construction classifications see: CC, Eurostat, 14 March 1997.

### Variables/indicators

#### Production index (industry and construction)

The production index provides a measure of the volume trend in value added at factor cost over a given reference period. The industrial production index is compiled for activities within NACE Rev. 2 Sections B, C and D. The production index for construction is compiled for building and for civil engineering. Dependent on the approximation method used (see below), the index of production should take account of:

- variations in type and quality of the commodities and of the input materials;
- changes in stocks of finished goods and services and work in progress;
- changes in technical input-output relations (processing techniques);
- services such as the assembling of production units, mounting, installations, repairs, planning, engineering, creation of software.

The data necessary for the compilation of such an index are generally not available on a sub-annual basis. In practice, suitable proxy values for the compilation of the indices are needed.

#### Industry:

- gross production values (deflated);
- volume data;
- turnover (deflated);
- work input;
- raw material input;
- energy input.

#### Construction:

- input data (consumption of typical raw materials, energy or labour);
- output data (production quantities, deflated production values or deflated sales values).

**Turnover (industry, retail trade and services)**

The objective of the turnover index is to show the evolution of the market for goods and services. Turnover comprises the total invoiced by the observation unit during the reference period. This corresponds to market sales of goods or services supplied to third parties. It excludes all duties and taxes on the goods or services invoiced by the unit including the VAT invoiced by the unit vis-à-vis its customer and other similar deductible taxes directly linked to turnover. For industry, the turnover index is compiled for domestic and non-domestic markets, with the latter split between euro area and non-euro area markets. The domestic market is defined as customers resident in the same national territory as the observation unit.

**Volume of sales (retail trade)**

The volume of sales represents the value of turnover in constant prices and as such is a volume index. It can be calculated as turnover at current prices deflated by the deflator of sales, or derived directly from the quantity of goods sold. The index is a business cycle indicator that shows the activity of the retail sector in volume. It is a short-term indicator for final domestic demand. The index is often interpreted as a consumer confidence indicator. It is compiled for NACE Rev. 2 Division 47 and its components at the Group and Class level.

**New orders (industry and construction)**

The objective of the new orders received index is to assess the evolution of total demand for products and services as an indication of future production. The coverage of the industrial new orders index includes NACE Rev. 2 Divisions 13, 14, 17, 20, 21, 24, 25, 26, 27, 28, 29 and 30. Given the volatile nature of orders within the activity of other transport equipment, a special aggregate for manufacturing industries working on orders, excluding transport equipment has been created. For the industrial index a distinction is made between orders on domestic and non-domestic markets, with the latter further split between euro area and non-euro area markets. The coverage of the construction new orders index includes NACE Rev. 2 Divisions 41 and 42.

The new orders index refers to goods and services that are to be provided by the observation unit, including those originating from sub-contractors. An order is defined as the value of the contract linking a producer and a third party in respect of the future deliveries by the producer of goods and services. The order is accepted if, in the producer's judgement, there is sufficient evidence for a valid agreement. New orders exclude all duties and taxes on the goods or services that will be invoiced by the unit, including VAT and other similar deductible taxes directly linked to turnover. All other charges (for example, transport or packaging) passed on to the customer are also included. Note that cancellations of orders are not deducted from the orders received.

**Employment (all activities)**

The employment index shows the evolution of employment. The index is defined as the total number of persons who work in the observation unit (including working proprietors or partners and unpaid family workers), as well as persons who work outside the unit, but who belong to it and are paid by it (for example, sales representatives, delivery personnel, repair and maintenance teams). Part-time workers are included as well. Excluded is manpower supplied to the unit by other enterprises. Member States can use the number of employees as an approximation of the number of persons employed.

**Hours worked (industry and construction)**

The index shows the evolution of hours worked. The index represents the aggregate number of hours actually worked during normal working hours, during overtime and covers the time that is spent at the place of work on tasks such as preparing the site and time corresponding to short periods of rest at the work place. This variable excludes hours paid but not actually worked such as for annual leave, holidays and sickness leave. If the exact number of hours actually worked is not known, it may be estimated on the basis of the theoretical number of working hours and the average rate of absences (for example, sickness or maternity).

### *Wages and salaries (industry and construction)*

The gross wages and salaries index approximates the development of the wages and salaries bill. Wages and salaries are defined as the total remuneration, in cash or in kind, payable to all persons counted on the payroll (including homeworkers), in return for work done during the accounting period. This is regardless of whether the wages are paid on the basis of working time, output or piecework and whether they are paid regularly or not. Included are all basic wages and salaries, allowances, bonuses and commissions, taxes, contributions and other amounts payable by employees and withheld at source by the employer. Social contributions, taxes or other labour cost expenditure paid by employer, training costs, reimbursements for equipment or travelling, and similar costs are not included.

### *Output prices / producer prices (industry)*

The output price index (or producer price index) shows monthly price changes in industrial activities, which can be an indicator of inflationary pressure before it reaches the consumer. The indices are compiled for activities within NACE Rev. 2 Sections B, C and D, as well as Division 36. Output price indices are compiled for the domestic and the non-domestic market, with the latter further split between euro area and non-euro area markets. Given the volatile nature of energy prices, a special aggregate for total industry excluding energy has been created, so that underlying price developments may be studied.

All price-determining characteristics of the products should be taken into account, including the quantity of units sold, transport provided, rebates, service conditions, guarantee conditions and destination. The appropriate price is the basic price that excludes all duties and taxes on the goods and services invoiced by the unit including VAT invoiced by the unit vis-à-vis its customer and similar deductible taxes directly linked to turnover. Subsidies on products received by the producer, if there are any, should be added. The actual transaction price should be measured, and not a list price. If transport costs are included this should be part of the product specification. The price of period *t* should refer to the moment

when the order is made, not the moment when the commodities leave the factory gates. The measured price should in principle reflect the average price level during the reference period. In practice, the information actually collected may refer to a particular day in the middle of the reference period that should be determined as a representative figure for the reference period.

### *Output prices (services)*

Regulation 1158/2005 of the European Parliament and the Council amended the original STS Regulation and introduced a requirement for producer price indices for a selection of service activities (SPPIs). A selection of the available data is presented in this publication. SPPIs are presented with an average base year of 2006=100. The first quarter of 2006 was the first reference period for which SPPIs were required, although many Member States had derogations to start providing data later than this. The basic form of the index is its gross (also known as unadjusted) form. The information is collected each quarter (no monthly presentation is available). For services, the following specific points apply.

- Output prices for services show the price development for services delivered to customers that are enterprises or persons representing enterprises, referred to as B2B (business to business) prices – for some activities where sales to households are also significant a B2All price index is also of interest.
- The appropriate price measure is the transaction price. The price should take into account any discounts, rebates, surcharges, etc. that may apply. Taxes on products should be excluded from prices whereas subsidies on products received by the producer, if there are any, should be added.
- The price should be recorded at the date of delivery of the service. If the service delivery spans over several time periods, appropriate adjustments have to be made.

More information on SPPIs is available from the Methodological guide for developing producer price indices for services (Eurostat product code KS-BG-06-003).

### **Import prices**

Import price indices aim to measure the transaction price development of imported goods purchased from non-domestic areas by domestic residents. All the related services are initially excluded from the scope. The price indices should track the price movements of comparable items over time. It is essential that all price-determining characteristics of the products are taken into account, including quantity of units sold, transport provided, rebates, service conditions, guarantee conditions origin and destination. The specification must be such that in subsequent reference periods, the observation unit is able uniquely to identify the product and to provide the appropriate price per unit. The product coverage is limited to Sections B, C and D of the Classification of Products by Activity (CPA) - related services are excluded.

The price is the c.i.f. (cost, insurance, and freight) price at the border excluding all duties and taxes on the goods and services to be shouldered by the observation unit. The price should be an actual transaction price, and not a list price, therefore discounts should be deducted from the price. The price index compilation should take into account and adjust for quality changes in products. Imports are recorded when the ownership of the goods is transferred (i.e. when the parties record transaction in their books or account).

The distinction between markets (domestic, non-domestic, euro area, non-euro area) requires separate indices to be compiled according to the origin/destination of the product, which is determined by the residency of the third party that has supplied/ordered/purchased the product. These markets are defined using a consistent composition of the euro area based on 16 countries.

### **Construction costs**

The construction costs index measures the trend of prices for the factors that are involved in the construction process; hence the evolution of the costs incurred by the contractor. Costs that constitute components of construction costs also include plant and equipment, transport, energy and other costs. Architect's fees are not part of construction costs. The index does not take account of changes in productivity or of variations in the contractor's profit margin. In certain countries, it is also called a 'factor price index'. This index covers costs for new residential buildings excluding residencies for communities.

An output price index is used by some Member States as a proxy for construction costs.

### **Building permits (construction)**

Two permits indices are compiled, one for the number of dwellings for which permits have been issued, and the other for the area authorised. The objective of building permits indices is to assess the future development of construction activity. A building permit is an authorisation to start work on a building project. As such a permit is the final stage of planning and building authorisations, prior to the start of work. It may be the case that a large proportion of permits are not used or there is a long time lag between permits and the start of the building project, however, the index gives indications of the workload for the building industry in the near future.

**Number of dwellings:** indices of the number of dwellings are compiled for one-dwelling residential buildings and residential buildings with two and more dwellings. A dwelling is a room or suite of rooms and its accessories in a permanent building or structurally separated part thereof, which by the way it has been built, rebuilt, converted and so on, is intended for private habitation. It should have separate access to a street or to a common space within the building. Detached rooms or habitation which are clearly to be used as a part of the dwelling should be counted as part of the dwelling. A dwelling may thus be constituted of separate buildings within the same enclosure, provided they are intended for habitation by the same household.

**Area:** this index is compiled from the square metre of useful floor area of buildings for which permits have been granted. This index is compiled for all types of buildings. The useful floor area of a building is measured within its external walls, excluding construction areas, functional areas for ancillary use (for example, areas occupied by heating and air-conditioning installations or power generators) or thoroughfares (for example, areas of stairwells, lifts, escalators). Alternative volume measures may be used.

## Base years/weights

European short-term business statistics are presented with 2005 as the base year. Generally Member States compile their data using weights from 2005. The following table shows the weights that are generally used for each indicator, although some countries may use alternative weights.

### Weights used for each indicator in STS

Index	Used weight
Production	Value added at factor costs
Turnover	Turnover
Domestic turnover	Domestic turnover
Non-domestic turnover	Non-domestic turnover
New orders	Turnover
Domestic new orders	Domestic turnover
Non-domestic new orders	Non-domestic turnover
Employment	Number of persons employed
Hours worked	Number of hours worked
Wages and salaries	Wages and salaries
Output prices	Turnover
Domestic output prices	Domestic turnover
Non-domestic output prices	Non-domestic turnover
Import prices	Imports
Permits	Turnover

## Decomposition - forms of indices

The use of time series decomposition makes it possible to determine sub-annual growth rates that are easier to interpret and provides a means to establish long-term developments uninfluenced by seasonal and sub-annual factors. The normal breakdown of a gross or unadjusted time series makes it possible to identify the trend, the cycle, the seasonal variation and the erratic fluctuations.

## Adjustment of working days

The adjustment of working days is intended to adjust for calendar effects, whatever their nature. The number of working days for a given month depends on the timing of certain public holidays, the possible overlap of certain public holidays and non-working days, the fact that a year is a leap year or not, and other reasons. Short-term statistics (STS) are often strongly affected by calendar issues. For example, there may be close connections between industrial production and the hours worked or between retail sales and the number of trading days. In order to ensure comparability of these statistics across time the data need to be working-day adjusted. Two issues determine the outcome of working-day adjustment:

- the adjustment method, in other words proportional or regression methods;
- the number of working days, in other words how many working days (or more generally how much working time) there are in a month (or other reference period).

## Seasonal adjustment

Seasonal adjustment, or the adjustment of seasonal variations, aims, after adjusting for calendar effects, to take account of the impact of the known seasonal factors that have been observed in the past. For example, in the case of the production index, annual summer holidays have a negative impact on industrial production. The level of this impact varies according to the country being studied and whether or not observation units close. It also depends on the area of activity concerned. In addition, the situation is complicated as these practices/habits/traditions change over time. Most series, with the notable exception of prices, are seasonally adjusted. If the national statistical office providing the data does the seasonal adjustment, these series are used. If no seasonally adjusted series are supplied, Eurostat perform the seasonal adjustment.

### Trend cycle

The trend is a slow variation over a long period of years, generally associated with the structural causes of the phenomenon in question. In some cases the trend shows a steady growth, in others, it may move either downwards or upwards. The cycle is a quasi periodic oscillation, characterised by alternating periods of higher and lower rates of change possibly, but not always, involving expansion and contraction. In most cases it is related to fluctuations in overall economic activity. If the irregular component of the time series is relatively important, the trend cycle series generally offers a better series for analysis of longer-term past developments. However, this advantage is less clear when analysing very recent developments. Trend cycle values for recent periods may be subject to greater revisions than the equivalent seasonally adjusted values and hence the latter may be more appropriate for the analysis of very recent developments. This is particularly true around turning points. Trend cycle series may however converge to stable results more quickly than seasonally adjusted series.

### Growth rates

The changes, which are given in the tables and graphs in this publication, show two different growth rates. The first being for the latest period compared with the previous period (for example, month on month or quarter on quarter) - here a seasonally adjusted series is used wherever possible. The second growth rate is for the latest period compared with the same period of a year before: here a series only adjusted for the number of working days is used wherever possible, else the indices used are unadjusted (in other words, gross series).

### EU-27 and euro area aggregates

EU-27 and euro area data are first estimated when 60 % of the weighted national data is available. These geographical aggregates are calculated for unadjusted/gross series and for working day adjusted series, and from these two basic forms, seasonally adjusted and trend cycle forms are derived using TRAMO & SEATS. Missing components for these two geographical aggregates are estimated using the average growth rate of the available components and the past data of the missing components.

Growth rates and indices for the euro area are consistently based on an aggregate of the 16 Member States that, at the time of writing, use the euro as a common currency.

### European aggregates and countries

EU-27	27 Member States of the European Union
Euro area	16 Member States that use the euro as a common currency
BE	Belgium
BG	Bulgaria
CZ	the Czech Republic
DK	Denmark
DE	Germany
IE	Ireland
EE	Estonia
EL	Greece
ES	Spain
FR	France
IT	Italy
CY	Cyprus
LV	Latvia
LT	Lithuania
LU	Luxembourg
HU	Hungary
MT	Malta
NL	the Netherlands
AT	Austria
PL	Poland
PT	Portugal
RO	Romania
SI	Slovenia
SK	Slovakia
FI	Finland
SE	Sweden
UK	the United Kingdom
NO	Norway
CH	Switzerland
